

PETER FASAE

Full-Stack Software Engineer · TypeScript & React · Node.js & Serverless AWS · Test-driven

London, UK · 07403 457518 · pfasae@gmail.com · peterfasae.github.io · github.com/PeterFasae · linkedin.com/in/peter-fasae-5a7482b8

PROFILE

I have been writing code since 2019, when I started an advanced diploma in software engineering in Lagos and finished it in the top 7% of my cohort. I kept building through the move to London, through agency work, and through a degree I completed last summer with First-Class Honours. The part I enjoy most is the untangling: tracing a broken Apple Pay checkout back to a change in how tokens were processed, or pinning a privacy promise down to a test that fails the moment a single request escapes. I have shipped into a live React and TypeScript product, delivered for agency clients, designed and deployed a serverless AWS application of my own, and I now review production-grade code in three languages for correctness. What I am after is a full-stack engineering role where I can own a feature end to end, from the React component through the API to the data store, on a team that takes testing seriously.

SELECTED EVIDENCE

- **Production debugging.** Investigated a checkout failure that blocked Apple Pay on mobile Safari in a live payment flow, isolated it to changed token processing in a third-party SDK, and supported the compatibility release.
- **System design.** Designed and deployed Clarity, a serverless AWS application whose privacy guarantee is enforced by an automated test rather than a policy document, behind a suite of 121 tests.
- **Code review at depth.** Assess model-generated Python, Rust and PHP against a structured rubric for correctness, edge cases and failure modes.
- **Formal grounding.** First-Class BSc in Information Technology, Advanced Diploma in Software Engineering with Distinction (top 7% of cohort), AWS Certified Cloud Practitioner.
- **Full-stack range.** Shipped across the whole stack: React and Next.js front ends, Node and Express APIs, REST and third-party integrations, PostgreSQL and DynamoDB storage, OAuth 2.0 and Cognito authentication, and CI/CD through GitHub Actions.

TECHNICAL

DAILY TypeScript · JavaScript (ES6+) · React · Next.js · Node.js / Express · REST APIs · Git & GitHub

PRODUCTION Python · SQL / PostgreSQL · AWS (Lambda, API Gateway, DynamoDB, Cognito, EC2, S3) · OAuth 2.0 · Jest · Vitest · React Testing Library · GitHub Actions & CI/CD

FAMILIAR PHP · Solidity · Rust (code review) · Prisma · Redis · Docker · Playwright · Railway · Microsoft Intune & Jamf

PRACTICE Test-driven development · regression and integration testing · code review · root-cause debugging · edge-case and failure-mode analysis · CI/CD · privacy by design · defensive security · accessibility · technical documentation

HOW I WORK

- **Test the thing that matters, not everything.** At BlueBow I put Jest regression tests around the code most prone to repeat defects, so that class of failure surfaces in CI rather than in a customer's checkout. On Clarity the privacy guarantee is a test that fails if a request escapes, not a paragraph in a README.
- **Write it down so it outlives me.** The onboarding documentation I produced at BlueBow was still in use by new starters after my internship ended, and at T21 the records and documentation were part of how the service actually functioned.

ENGINEERING EXPERIENCE

Alignerr, AI Coding Contributor Remote · Nov 2025 to present

Human evaluation of model-generated software

- Review and evaluate model-generated code across Python, Rust and PHP, judging correctness and catching the defects that survive a surface read. The work is failure-mode analysis as a full-time discipline, across three languages and unfamiliar codebases every day.
- Work to a structured rubric covering edge cases, error handling and reliability, producing written technical feedback that goes directly into model training quality.
- Delivered greenfield vibe-coding annotations across multiple AI models, building first-hand judgement about where generated code can be trusted and where it needs a human gate, which is the practice engineering teams are now trying to formalise.

BlueBow Group, Software Developer Intern London · Feb 2025 to Aug 2025

React and TypeScript product team

- Investigated a checkout regression that blocked Apple Pay on mobile Safari after a payment SDK upgrade: reproduced the failure, isolated it to a change in how the SDK processed payment tokens, and supported the compatibility release that restored the payment path.
- Shipped third-party authentication and analytics integrations into a live React and TypeScript product, working against external API contracts and an existing codebase rather than a greenfield one.

- Wrote Jest regression tests around the areas most prone to repeat defects, and handled day-to-day troubleshooting of application issues alongside the feature work.
- Produced technical and onboarding documentation that was still in use by new starters after the internship ended.
- Ran device enrolment across Microsoft Intune, Jamf and Apple Business Manager, combining development work with the operational side of getting software onto real users' machines.

Acumen Digital, Web Developer Nigeria · Sep 2023 to Jun 2024

Multi-client web delivery

- Built full-stack web applications end to end in Next.js, React, Node.js and PHP: front end, REST endpoints, back-end services and database layer across five or more client builds.
- Implemented authentication and authorisation flows and integrated third-party APIs, working to each client's own requirements rather than a house template.
- Debugged and maintained several codebases concurrently, moving between unfamiliar stacks without a shared internal framework to fall back on.
- Translated business requirements into technical scope and stayed with the work through to delivery.

ENGINEERING PROJECTS

Clarity, privacy-first cloud note-taking system React · Node.js · AWS · 2025

React front end, API Gateway and Lambda back end, DynamoDB storage, Cognito authentication. Final-year project within a First-Class degree.

- Designed the system around an explicit privacy boundary: a note cannot reach a third-party AI service unless the user has actively opted in.
- Enforced that boundary in code rather than in documentation, with a test that fails if a single request escapes while the setting is off. The guarantee is verifiable, not asserted.
- Backed the whole system with 121 automated tests covering the privacy guarantee and the core note operations.
- Built entirely serverless, treating authentication, authorisation and privacy by design as architectural concerns rather than features bolted on at the end.
- Case study and write-up: peterfasae.github.io/clarity.html

Blockchain voting, contributor Solidity · Ethereum

- Reviewed contract code and identified repeated persistent-storage writes inside a loop, a costly pattern on Ethereum where every storage write is charged. Proposed accumulating the value in memory and writing once, and another contributor implemented the optimisation.

ADDITIONAL EXPERIENCE

T21 Services UK, Systems Support & Coordinating Supervisor UK · Feb 2025 to Aug 2026

Health and care provider supporting NHS service delivery

- Application and systems support: reproduced staff-reported faults, investigated root causes, and resolved or escalated them. The same debugging loop as production support, on systems I did not write.
- Maintained the technical documentation and records the service depended on, onboarded colleagues onto systems and procedures, and identified process improvements.

Marks & Spencer, Shift Lead London · 2024 to 2026

- Spotted a recurring spreadsheet report that was costing the team hours and prototyped a Python tool to automate part of it. Unprompted, outside the job description, and the reason I know automation is worth reaching for before process is.
- Led a shift team through peak trading while studying full-time, handling around 60 customer queries a day.

EDUCATION

Middlesex University, BSc (Hons) Information Technology, First-Class Honours London · Jul 2025

Modules included Advanced Software Engineering, Full Stack Development, Defensive Security and Strategic Information Systems. Final-year project: Clarity (above).

Aptech Computer Education, Advanced Diploma in Software Engineering Lagos, Nigeria · 2019 to 2021

Distinction, top 7% of cohort. Two-year programme across programming, software engineering, web development, databases and application design.

TEACHING, CERTIFICATIONS & COMMUNITY

- Co-ran a weekly coding club teaching JavaScript to around 20 secondary-school students, planning the sessions and explaining programming concepts to complete beginners.
- AWS Certified Cloud Practitioner (2025). The Odin Project, Full Stack JavaScript (2023), a self-directed project-based curriculum. Civil Service Graduate Aspiration Programme. Volunteer with Volunteers on Wheels.
