

PETER FASAE

Full-Stack Engineer · TypeScript & React · Node.js & Serverless AWS

London, UK · 07403 457518 · pfasae@gmail.com

peterfasae.github.io · github.com/PeterFasae · linkedin.com/in/peter-fasae-5a7482b8

Graduate visa — eligible to work in the UK without sponsorship until October 2027. No sponsorship required.

SUMMARY

Full-stack engineer with commercial experience across a live React and TypeScript product, five or more agency client builds, and eighteen months of application support on systems I did not write. Looking for a full-stack role where I can own a feature from the React component through the API to the data store.

SELECTED EVIDENCE

- **Production debugging.** Investigated a checkout failure that blocked Apple Pay on mobile Safari in a live payment flow, isolated it to changed token processing in a third-party SDK, and supported the compatibility release.
- **System design.** Designed and built Clarity, a serverless AWS application whose privacy guarantee is enforced by an automated test rather than a policy document, behind a suite of 121 tests.
- **Code review at depth.** Assess model-generated Python, Rust and PHP against a structured rubric for correctness, edge cases and failure modes.
- **Formal grounding.** First-Class BSc in Information Technology, Advanced Diploma in Software Engineering with Distinction (top 7% of cohort), AWS Certified Cloud Practitioner.
- **Full-stack range.** Shipped across the whole stack: React and Next.js front ends, Node and Express APIs, REST and third-party integrations, PostgreSQL and DynamoDB storage, OAuth 2.0 and Cognito authentication, and CI/CD through GitHub Actions.

HOW I WORK

- **Test the thing that matters, not everything.** At BlueBow I put Jest regression tests around the code most prone to repeat defects, so that class of failure surfaces in CI rather than in a customer's checkout. On Clarity the privacy guarantee is a test that fails if a request escapes, not a paragraph in a README.
- **Write it down so it outlives me.** The onboarding documentation I produced at BlueBow was still in use by new starters after my internship ended, and at T21 the records and documentation were part of how the service actually functioned.

EXPERIENCE

AI Coding Contributor — Alignerr

Contract, part-time (~20 hrs/week, weekends) · Remote · Nov 2025 – present

- Review and evaluate model-generated code across Python, Rust and PHP, judging correctness and catching defects that survive a surface read.
- Work to a structured rubric covering edge cases, error handling and reliability, producing written technical feedback.
- Daily practice in reading unfamiliar codebases in three languages and deciding where generated code can be trusted and where it needs a human gate.

Systems Support & Coordinating Supervisor — T21 Services UK

Contract, part-time · UK · Feb 2025 – Aug 2026

Health and care provider supporting NHS service delivery

- Application and systems support: reproduced staff-reported faults, investigated root causes, resolved or escalated. The same debugging loop as production support, on systems I did not write.
- Maintained the technical documentation and records the service depended on.
- Onboarded colleagues onto systems and procedures, and identified process improvements.

Software Developer Intern — BlueBow Group

Remote internship · London · Feb – Aug 2025

React and TypeScript product team

- Investigated a checkout regression that blocked Apple Pay on mobile Safari after a payment SDK upgrade: reproduced the failure, isolated it to a change in how the SDK processed payment tokens, and supported the compatibility release that restored the payment path.
- Shipped third-party authentication and analytics integrations into a live React and TypeScript product, working against external API contracts in an existing codebase.

- Wrote Jest regression tests around the areas most prone to repeat defects, and handled day-to-day troubleshooting of application issues alongside the feature work.

Web Developer — Acumen Digital

Lagos, Nigeria · Sep 2023 – Jun 2024

Multi-client web delivery

- Built full-stack web applications end to end in Next.js, React, Node.js and PHP across five or more client builds: front end, REST endpoints, back-end services and database layer.
- Implemented authentication and authorisation flows and integrated third-party APIs to each client's own requirements.
- Debugged and maintained several codebases concurrently, moving between unfamiliar stacks.

Shift Lead — Marks & Spencer

Part-time alongside study, then night shift · London · Dec 2024 – Jul 2026

- Spotted a recurring spreadsheet report costing the team hours and prototyped a Python tool to automate part of it. Unprompted and outside the job description.
- Led a shift team through peak trading while studying full-time, handling around 60 customer queries a day.

PROJECTS

Clarity — **privacy-first note-taking system** — React, Node.js, Serverless AWS · 2025 to present · final-year project

- Designed and built around an explicit privacy boundary: a note cannot reach a third-party AI service unless the user has actively opted in.
- Enforced that boundary in code, not documentation. The test points the AI SDK at an HTTP server inside the test rig and counts every outbound request through any code path, then asserts zero while the flag is off and non-zero once it is on.
- 121 automated tests across the implementation.
- Serverless on AWS: thirteen Lambda functions each with an IAM role scoped to exactly what it needs, API Gateway, DynamoDB, Cognito, React front end. CloudWatch alarms on error rate rather than error count.
- Public evidence repository with the architecture, the decisions log kept during the build, the infrastructure definition and a runnable dependency-free component: github.com/PeterFasae/clarity-architecture
- Case study: peterfasae.github.io/clarity.html

Blockchain voting — **contributor** — Solidity, Ethereum

- Reviewed contract code and identified repeated persistent-storage writes inside a loop, a costly pattern on Ethereum. Proposed accumulating in memory and writing once; another contributor implemented it.

TECHNICAL

Daily: TypeScript · JavaScript (ES6+) · React · Next.js · Node.js / Express · REST APIs · Git & GitHub

Production: Python · SQL / PostgreSQL · AWS (Lambda, API Gateway, DynamoDB, Cognito, EC2, S3) · OAuth 2.0 · Jest · Vitest · React Testing Library · GitHub Actions & CI/CD

Familiar: PHP · Solidity · Rust (code review) · Prisma · Redis · Docker · Playwright · Microsoft Intune & Jamf

Practice: Test-driven development · regression and integration testing · code review · root-cause debugging · failure-mode analysis · CI/CD · privacy by design · accessibility · technical documentation

EDUCATION & CERTIFICATION

BSc (Hons) Information Technology, First-Class Honours — Middlesex University

London · Sep 2024 – Jul 2025 · one-year top-up following the Aptech Advanced Diploma

Modules: Advanced Software Engineering, Full Stack Development, Defensive Security, Strategic Information Systems. Final-year project: Clarity.

Advanced Diploma in Software Engineering, Distinction (top 7%) — Aptech Computer Education

Lagos, Nigeria · 2019 – 2021

AWS Certified Cloud Practitioner · 2025

ADDITIONAL

Co-ran a weekly coding club teaching JavaScript to around 20 secondary-school students. The Odin Project, Full Stack JavaScript (2023). Civil Service Graduate Aspiration Programme. Volunteer with Volunteers on Wheels.
